

OPTIMIZATION OF AERO-BRACKET FOR LASER POWDER BED FUSION

What?

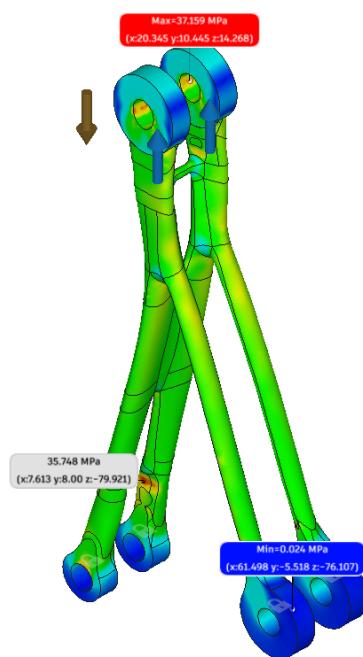

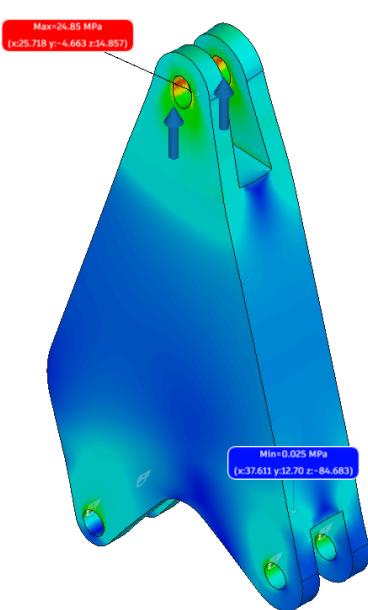

- Optimized an aerospace bracket for **LP-PBF** manufacturing
- Aimed to minimize mass while ensuring safety under a **1600 N** tensile load

How?

- Used Fusion 360 **Generative Design** to create an optimized AlSi10Mg structure
- Validated FEA results using hand calculations and physical tensile testing

Results

- Achieved **86%** mass reduction (223g to 31g) with a **Safety Factor of 6.5**
- Withstood **9018 N** (machine limit) without failure, exceeding requirements by **560%**
- Calculations confirmed peak stress (~**209 MPa**) remained safely below the **460 MPa** limit

TRANSPORTATION VIA ULTRASONIC LEVITATION SYSTEM

What?

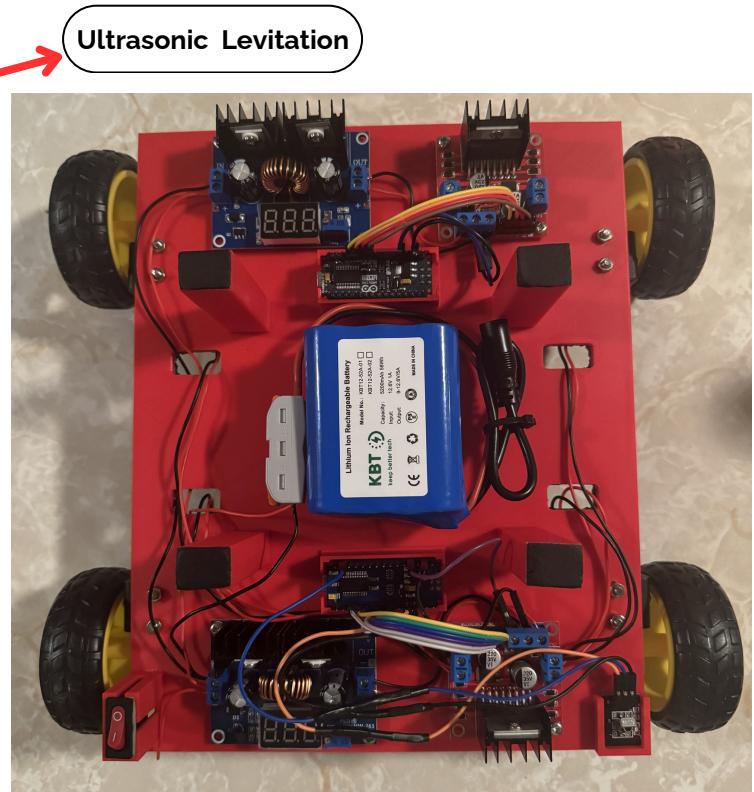

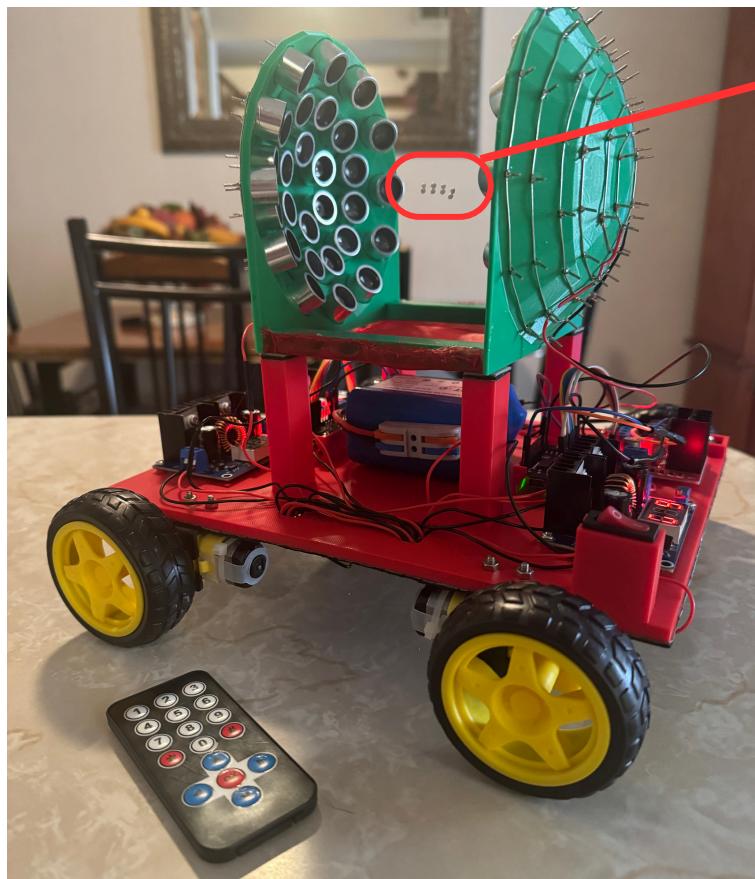

- Created a transport system using **ultrasonic levitation**
- Aimed to move small particles of styrofoam without any physical contact
- Focused on demonstrating non-contact object handling

How?

- Utilized Arduino Nanos to control the systems
- Integrated transducers, buck converters, H-bridges, IR sensor and motors for levitation and transportation
- Used Fusion 360 to design and **3D-print** a custom base for stability and transportation of the systems

Results

- Achieved stable levitation of small particles of styrofoam using ultrasonic waves
- Enabled precise remote control for object movement
- Demonstrated effective non-contact transport capabilities

LASER SECURITY ALARM SYSTEM

What?

- Designed a **Laser Security Alarm System** for enhanced vault security.
- Aimed to detect unauthorized access

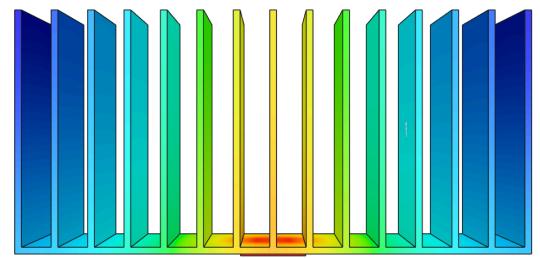

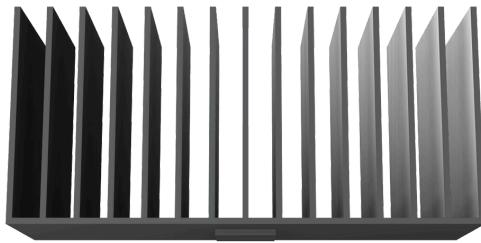

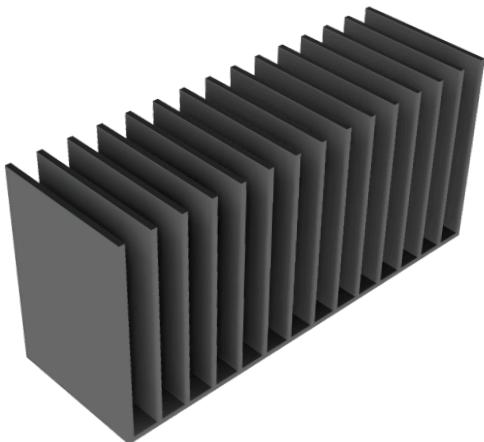

How?

- Integrated a laser with strategically placed mirrors to form a detection grid.
- Utilized mirrors, alarms, laser, servo, photoresistor, LCD display, and **RFID and I₂C technology**
- Connected **audiovisual components** to trigger an alarm when the laser beam was interrupted
- Implemented an RFID sensor for key card access for authorized entry

Results

- Achieved accurate detection of obstacles breaking the laser grid
- Successfully integrated RFID access control for user convenience
- Delivered a reliable, effective security solution for sensitive areas

HEAT SINK DESIGN

What?

- Design a heat sink that lowers a simulating CPU surface by **22±1°C**
- Performed a natural convection-cooled thermal simulation

How?

- Used Fusion 360 to design the heat sink and perform the **thermal simulations**
- Used **heat transfer formulas** to determine characteristics

Results

- The design fulfilled its purpose by reducing the temperature of the surface from **85°C to 64.3°C**
